1 Introduction

1.1 Section

Citation test [Lam94].

Acronyms must be added in `main.tex` and are referenced using macros. The first occurrence is automatically replaced with the long version of the acronym, while all subsequent usages use the abbreviation.

E.g. `\ac{TUM}`, `\ac{TUM}` $\Rightarrow$ Technical University of Munich (TUM), TUM

For more details, see the documentation of the acronym package¹.

1.1.1 Subsection

See Table 1.1, Figure 1.1, Figure 1.2, Figure 1.3.

Table 1.1: An example for a simple table.

3 Mathematical Formulation of BEM

3.1 Acoustic Wave Equation

The propagation of acoustic waves in a homogeneous, inviscid fluid medium is governed by the linear wave equation for the acoustic pressure $p(\mathbf{x}, t)$:

$$\nabla^2 p(\mathbf{x}, t) - \frac{1}{c^2} \frac{\partial^2 p(\mathbf{x}, t)}{\partial t^2} = 0 \quad (3.1)$$

where $\mathbf{x}$ is the position vector, t is time, and c is the speed of sound in the medium.

To derive the Helmholtz equation, we consider a time-harmonic acoustic field. We assume the pressure can be represented as a complex function oscillating with angular frequency ω :

$$p(\mathbf{x}, t) = P(\mathbf{x})e^{-i\omega t} \quad (3.2)$$

where $P(\mathbf{x})$ is the spatial component of the pressure (the phasor) and $i = \sqrt{-1}$ is the imaginary unit.

Substituting Equation (3.2) into the wave equation (3.1):

$$\nabla^2 (P(\mathbf{x})e^{-i\omega t}) - \frac{1}{c^2} \frac{\partial^2}{\partial t^2} (P(\mathbf{x})e^{-i\omega t}) = 0 \quad (3.3)$$

Calculating the time derivatives:

$$\frac{\partial}{\partial t} (P(\mathbf{x})e^{-i\omega t}) = -i\omega P(\mathbf{x})e^{-i\omega t} \quad (3.4)$$

$$\frac{\partial^2}{\partial t^2} (P(\mathbf{x})e^{-i\omega t}) = (-i\omega)^2 P(\mathbf{x})e^{-i\omega t} = -\omega^2 P(\mathbf{x})e^{-i\omega t} \quad (3.5)$$

Substituting this back into the wave equation:

$$e^{-i\omega t} \nabla^2 P(\mathbf{x}) - \frac{1}{c^2} (-\omega^2 P(\mathbf{x})e^{-i\omega t}) = 0 \quad (3.6)$$

Dividing by the common time factor $e^{-i\omega t}$ (which is non-zero) and rearranging the terms:

$$\nabla^2 P(\mathbf{x}) + \frac{\omega^2}{c^2} P(\mathbf{x}) = 0 \quad (3.7)$$

Introducing the wavenumber $k = \omega/c$, we arrive at the homogeneous Helmholtz equation:

$$\nabla^2 P(\mathbf{x}) + k^2 P(\mathbf{x}) = 0 \quad (3.8)$$

3.2 Boundary Element Method

3.2.1 Boundary Integral Formulation

The Boundary Element Method (BEM) solves the Helmholtz equation by transforming it into an integral equation defined on the boundary of the domain. This transformation is typically achieved using Green's Second Identity.

Let Ω be the domain containing the fluid and Γ be its boundary. For two scalar fields P and G in Ω , Green's Second Identity states [Wu00]:

$$\int_{\Omega} (P \nabla^2 G - G \nabla^2 P) d\Omega = \int_{\Gamma} \left(P \frac{\partial G}{\partial n} - G \frac{\partial P}{\partial n} \right) d\Gamma \quad (3.9)$$

where n is the outward unit normal vector to the boundary.

We choose $P(\mathbf{x})$ to be the acoustic pressure, satisfying the Helmholtz equation derived in Equation (3.8):

$$\nabla^2 P(\mathbf{x}) + k^2 P(\mathbf{x}) = 0 \quad (3.10)$$

We choose $G(\mathbf{x}, \mathbf{y})$ to be the fundamental solution (Green's function) of the Helmholtz equation, which satisfies the inhomogeneous equation with a point source at $\mathbf{y}$:

$$\nabla^2 G(\mathbf{x}, \mathbf{y}) + k^2 G(\mathbf{x}, \mathbf{y}) = -\delta(\mathbf{x} - \mathbf{y}) \quad (3.11)$$

where δ is the Dirac delta function. For 3D acoustics, the free-space Green's function satisfying the Sommerfeld radiation condition is given by [Kir98]:

$$G(\mathbf{x}, \mathbf{y}) = \frac{e^{ikr}}{4\pi r} \quad \text{with} \quad r = |\mathbf{x} - \mathbf{y}| \quad (3.12)$$

Substituting these into Green's Second Identity for a source point $\mathbf{y}$ inside the domain Ω :

$$P(\mathbf{y}) = \int_{\Gamma} \left(G(\mathbf{x}, \mathbf{y}) \frac{\partial P}{\partial n}(\mathbf{x}) - P(\mathbf{x}) \frac{\partial G}{\partial n}(\mathbf{x}, \mathbf{y}) \right) d\Gamma(\mathbf{x}) \quad (3.13)$$

As the source point $\mathbf{y}$ is moved to the boundary Γ , the integrals become singular. Evaluating the singularity using a limiting process yields the Boundary Integral Equation (BIE) [Mar08]:

$$C(\mathbf{y})P(\mathbf{y}) = \int_{\Gamma} \left(G(\mathbf{x}, \mathbf{y}) \frac{\partial P}{\partial n}(\mathbf{x}) - P(\mathbf{x}) \frac{\partial G}{\partial n}(\mathbf{x}, \mathbf{y}) \right) d\Gamma(\mathbf{x}) \quad (3.14)$$

where $C(\mathbf{y})$ is the geometric coefficient (solid angle). For a smooth boundary, $C(\mathbf{y}) = 0.5$.

3.3 Discretization

To solve the BIE numerically, the boundary Γ is discretized into N boundary elements. The pressure P and its normal derivative $q = \partial P / \partial n$ are approximated using shape functions.

Applying the collocation method at the nodes leads to a system of linear algebraic equations:

$$\mathbf{H}\mathbf{P} = \mathbf{G}\mathbf{Q} \quad (3.15)$$

where $\mathbf{H}$ and $\mathbf{G}$ are the dense, nonsymmetric influence matrices resulting from the integration of the fundamental solution and its derivative, and $\mathbf{P}$ and $\mathbf{Q}$ are vectors containing the nodal values of pressure and normal velocity, respectively.

4 The Fast Multipole Method Framework

Lorem ipsum dolor sit amet, consectetur adipiscing elit. Ut purus elit, vestibulum ut, placerat ac, adipiscing vitae, felis. Curabitur dictum gravida mauris. 7 Conclusion and Future Directions

- Currently Burton - Miller is highly optimized for single dof per cell and for perfectly flat panels. That is, $FE_Degree = 0$ and $Mapping_Degree = 1$. To support higher degrees, we need to update the hypersingular calculation in the near field operator and the main assemble system method.
- There is some basic parallelization in the code for computing the translation matrices and for the matrix-vector multiplication done with OpenMP pragmas. But, Deal.ii has its native parallelization support using its native datatypes. The FMM also lends itself to parallelization where each node of the FMM tree may reside in an individual process and maintain its own near field matrix, with only the far-off node dipoles having to be passed around.
